

Threshold crossings at the stellar position, $T_{\star} \geq 5$

56

Stellar-frame line attribution, $\pm 50 \text{ km s}^{-1}$ mask

38

18 attributed to a catalogued transition

Rank against all 512 spatial controls

2

36 unattributed crossings below the screen

Recurrence and block-versus-position

0

both evaluated, neither recurs; 8 further crossings tested
off-chain, 51 repeat blocks in all, max $T_{\star}$ 3.94

nothing survives the chain; no crossing is carried forward

| reported alongside

Drift-following visibility fit

a position-and-epoch consistency check, not a filter in the chain

*measured on the released crossing list, of which 52 of the 56
above are the same crossing:*

- 51 of 56 crossings fitted, 5 untested in 3 blocks
- localised at the stellar position: 41
- 31 of those are unattributed
- clauses 2 and 3 reject 4 of the 45 reaching $\text{Re}/\sigma \geq 4$
- 12 controls resolve a rank of $\sim 1/13$; $E[\text{max of 12}] = 1.63$

a crossing is DEFINED by excess at this position and cell, so the

fit confirms the search rather than testing it independently
