(a) power: scan statistic (solid)
vs the 1 MHz bin count (dashed)
rejection rate, 95th-percentile cut
injected events in the cluster
cluster width
1 MHz
10 MHz
30 MHz
100 MHz
156 MHz
300 MHz
(b) offset from the nearest masked transition;
15 of 53 inside ±50 km s^{-1} (null 5.9)
crossings per bin
observed crossings
matched null (same windows,
their own channel grids)
Δv from the nearest masked transition (km s^{-1}, topocentric)
(c) the maximal band 230.423--230.723 GHz:
13 crossings, 9 of them CO(2--1)
maximal band (300 MHz)
line-attributed
unattributed
CO(2--1)
scan $p = 0.0025$; unattributed only $p = 0.233$
sky frequency (GHz)
